

WEATHER & FARMING

WEATHER AFFECTS EVERYONE, BUT ESPECIALLY FARMERS. HERE'S HOW:

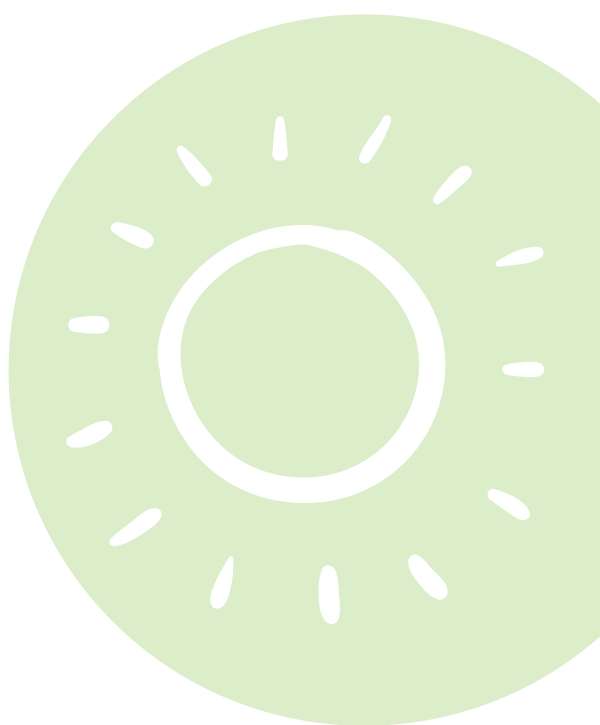

RAIN

Plants need water to grow. Rain is important in helping crops grow until they're ready for harvest. Too much rain can wash away the crop's soil and the crop may mold or die.

SUNLIGHT

The sun is also needed to help plants and crops. Plants produce special food and nutrients with light from the sun. Too much sun and the plants may dry out.

WIND

Wind helps plants capture food and nutrients. Wind also improves stem strength! Too much wind can damage the crops, sometimes beyond repair!

STORMS

High winds can break or damage crops. Hail can reduce the nutrients or destroy them. Too much rain can lead to soil loss or crop damage.
